Micro Assignment

Conversion

Come up with a conversion from something to something else. Your program must guide the user to input a value and output the converted value. Store variables that don't change in constants.

```
Give me a height in km and I will give you the height in stacked cars.
Input height (km): 0,324
0,324 km equals the height of 202,5 stacked cars (assuming a car height of 1,6 m)
```
